DRONE CHARGING STATION

PROJECT NAME:	Drone Charging Station (Metal Contact-Based System)
PROJECT GROUP:	Pavan Kajale, Riddhi Ambere

WHY THIS PROJECT ?

- This project focuses on the development of a contact-based drone charging station that enables automatic and safe battery charging using a metal contact system. In this approach, the UAV lands on a charging pad equipped with metal contact plates.
- The system allows the drone to recharge autonomously without manual cable connection, thereby improving operational efficiency and enabling long-duration or repetitive missions.

INTRODUCTION

- The 3D-Printed FPV Drone is a lightweight quadcopter designed primarily to test FPV flight characteristics and to train new pilots.
- The frame is fully 3D printed, allowing design flexibility and quick iteration. The drone serves as a testbed platform for experimenting with different FPV setups, flight controller tuning, and payload arrangements.

KEY FEATURES

- 3D-Printed Airframe enables rapid prototyping, customization, and low-cost replacement.
- FPV Training Platform
- Flight Testing Platform
- Used to test FPV flight dynamics before integrating FPV into advanced drones.
- Allows easy replacement and upgrading of components.
- Cost-Effective Development
- Significantly reduces risk and expense during pilot training.

- Use of 3D Printing
- 3D printing was chosen to:
- Reduce manufacturing cost
- Allow fast design iterations
- Enable lightweight structural designs
- Simplify repairs by reprinting damaged parts
- The frame design can be modified based on flight performance and pilot feedback.

RESULTS

- The 3D-printed FPV drone successfully demonstrated stable flight and effective FPV operation
- Minor vibrations were observed due to the lightweight printed structure, which provided valuable data for future design improvements.

FUTURE SCOPE

1. **Frame reinforcement using composite or carbon-infused filaments**
2. **Improved vibration damping techniques**
3. **Use as a swarm or multi-drone training platform**
